

Hero Me Gen7 Printhead Platform

Hero Me Gen7 Release 3.2 is available now and can be downloaded here: printables.com/model/39322

The Hero Me is an advanced printhead platform for 3D printers. The design concepts behind the Hero Me were to greatly improve print quality and part cooling performance, lower overall printhead weight, AND to make a very modular system. The Hero Me is to support as many different brands and models of 3D printers as possible, along with dozens of hotends and extruders, ABLs, fans, and other addons. After five years and seven generations, the Hero Me has been downloaded over a half million times. With tens of thousands of installs and satisfied makers, the Hero Me has delivered. Hero Me's standardized modularity has enabled the creation of over 700 different addons and remixes by individual makers to customize the Hero Me to their specific needs.

Hero Me Gen7 Release 3.2 continues with these design principles, and brings many design improvements, adding support for many new printers and printhead components while maintaining broad backward compatible to previous generations. The flexibility of the Hero Me Gen7 also makes it future proof, enabling easy printhead upgrades with matching STLs for each new component. The Hero Me also supports advanced tool swap systems including the Wham Bam MUTANT, PrinterMods Xchange, and the BigTreeTech HermitCrab. The Hero Me Gen7 is the top aftermarket printhead assembly and part cooling system available and just happens to be open source.

Hero Me Gen7.3.2 now supports over 100 3D Printer models (plus clones), 46 Hotends, 34 Extruders (over 40 mount options), 17 ABL Sensors, 35 Part Cooling Duct options, 12 Cable Management options, 11 ADXL345 mounts, and 4 LED bar mounts. With all these options the Hero Me Gen7 most likely has the parts you need for your specific printer setup.
